Jeffrey,

we worked the system till 11pm last night,. we have multiples issues:

when we return to LSJ, I want to start from scratch,.

The receiver as we know is not working with speaker audio out, needs replacing.

When Nick installed he didn't leave enough wires exposed to move the amps out to see behind the units.

Someone has installed the projector power cord to the same power strip that all components are utilizing. There must have been 9 plugs on one power stripped and plugged into the Monster power conditioner! The Monster Power conditioner has 9 inputs and only One was being used.

I moved the power plug from projector and installed direct into its own circuit, and still the projector shuts down hard after exactly 30min of use everytime. this morning Jermaine and I will remove the decorative front piece from projector to see if we are blocking any front air ventilation ports to see if this is overheating issue,. if not, as you recommended to Jermaine, use another Power conditioner, for pure 110v.

Speaker wires are labeled terrible and I need to ring out all the wires when I install the BelCanto amps with New receiver,.

Elliott at Audio Advisors was against the Integra unit for reliability, Christian at BelCanto store didn't favor any particular unit and offers Integra,. the extra Integra unit Jermaine tried had same problems, I don't have a good feeling about the Integra line personally at this point.

Mcintosh is built like a tank according to Elliott,. even though Atmos processors are not installed in Mcintosh, in order to get this sound, we need an 11 speaker surround system as well that fire towards ceiling etc.

I will shop preamp receivers today I PBI,.

Mcintosh?? is my vote to pair with the Belcanto amps
