Hi Rich,

To recap what we discussed earlier, the □tv (AppleTV) is not a video conference solution. It does have the ability to receive the display from an iPhone/iPad/Mac via AirPlay, but it does not have anyway to connect a camera or microphone to send audio/video to the other side.

If you used Facetime/Skype/Google Hangouts on an iPad, you could send the display (what you see) to the □tv, but the sound & picture that the other side get would be from the iPad's camera & microphone only.

Here is an Apple Forums discussion that outlines the same: <https://discussions.apple.com/thread/5210010>

It is certainly possible that Apple is considering adding Video/Audio inputs to the □tv for a future version, but they've made no announcements so far and I've not seen any supply chain rumors implying anything similar in imminent.

The logitech systems I've found all require a computer to do the actual conference (via

Skype/Google Hangouts, etc). The Google Chromebox is an all-inclusive system, but only works with Google+ Hangouts.
