Good morning Jeffrey,

I hope all is well. First I must apologize for the delay, as soon as I got back from South Dakota I had to go to South America for some meetings. I will now be in the US for quite some time and fully available.

As you know we mostly build for military and law-enforcement agencies around the world.

So where we usually begin is to fully understand the agency's requirements and mission profile.

Can I ask a few questions?

Where will the platform primarily be used? (AOR)

Are there any transportation limitations?

Slip size? (Moorage)

Tow vehicle limitations?

Launch and retrieval limitations? (Size of launch ramp or boat lift)

Fuel type availability?

(Gas, diesel, JP five and or JP eight.)

Is there commercial service and maintenance available in the area? If yes, what brands are serviced in that area?

If no, do we need to create an organic service and maintenance capability?

If unsure, we will investigate the service capabilities in the area once we are aware of where the platform will be used.

Then we focus on the basics:

Desired speed, range, crew size, weapons stations, ballistic protection, and basic use of the platform.

So the more we understand how, where, how often you plan to use the platform, the better we can do meeting your requirements and expectations.

I look forward to working with you and please feel free to e mail or call me at any time to discuss the project.

Best regards

Scott
