Out of 13 states we got 11 right. The ones we got wrong are =Y and WI.

In the =ast report, analyzed data was of 3 days in which Clinton got a positive =pike after she got clearance from FBI. However Trump dominated the =ocial media positively if we analyze one week data before starting time =f election, monthly data and entire data which we have gathered for =onths. Based on this we predicted on our Facebook page on 30th October =hat Trump will be next president of US.

Our model works but I think the =mportant question which we failed to answer is that how much historic =ata must be analyzed to make the right decision. This could have been =nswered if we had a Data Scientist. Also I believe its a great tool to =rack voters and get them to vote. It can be used in French elections =ext year or elections of Brazil in 2018 but unfortunately I have to =hut down this project as getting data from Twitter is expensive and the =tart up is running out of money.

I am going to focus on cyber security =gain and will definitely reach out if I have a powerful investable =dea.

Regards,
Zubair Khan
