Yes- a per dans email below.

I am in Mexico and will work out the final details with my team and Larry once I get back to the office on Monday. Need to work out how many days we will need the aircraft for to facilitate the entertainment system install and my suspicion is that it may be wise to just get everything done at this one time, including the shades and the switch at your chair.

Until my meeting on Monday, I do have a concern with trying to power both Bose systems off of existing 115vac power- even though we have identified that the subs (which consume 350watts each) are not 100% "on demand". "If" we can use existing power (without the need of a new frequency converter), then you would lose outlets in the cabin. This is not the right way to go and I would much rather find a re-conditioned freq converter to supply the required power outlets in the right hand credenza.

I also need to figure out what we can do about the existing monitor from utc aerospace as the one we need (high-definition with dual video inputs) is from another manufacturer (flight display systems and they have the unit ready to ship in one week from date of purchase).

Eric,

I called Bose Technical support and Custom Solutions Center and have a definite final answer...

Unless Custom solutions is doing the installation of the units 535 Series II units will NOT work for the application we want, it has also been stated that even if they did the custom install using their proprietary equipment the system still may not function properly. The solution to all of these issues would be to go with the now discontinued model V35, according to the Bose Custom solutions team the V35 is designed for exactly what we are looking to do (normally in 2 separate rooms) with having 2 zones playing independently or in sync.

V35 specs are nearly identical to the 535, the unit uses the same speakers and Acustimass module, the only major difference between the two is the software functionality. The V35 uses "9CBOSE Link" technology to make a hardwire link between consoles where the 535 will use the new wireless module due out in mid? 2014, I was unable to secure a real answer. Using the V35's would still require the same remote unit (PMC III) in order to properly operate both of these units.

-Fwd monitor will be changed to HD type.

-input- APPLE TV Jail-Broken to display all movies on IPAD regardless of internet connection

-Blue-Ray Player for carry on Monitor.

&n=sp; The inputs for the carry on 32" monitor would be=

- = Apple TV2 Version 5.2 "untethered"

- = A HD Blu-ray player (also plays DVD's CD's and MP3's)

&nbs=;

Two Bose systems, one for fwd listening of VIP Music

-Dock at VIP seat to include Headphone wire to play music thru Bose system.

&n=sp; The current Docking station at the VIP will remain and will be plugged into the Bose unit. Using this method will not allow you to use the Bose remote to control what your iPhone plays, all selections would have to be made on the iPhone itself. There is currently no provision for an iPad dock in the aircraft, Even so any iPad with a lightning connector cannot play video/pictures through hardware. This task should be done through the Apple TV for streaming.

=o:p>

-Bose systems will be able to play music via FWD system and Credenza speaker system at the same time, to fill the cabin?

 Yes, by utilizing 2 V35 units lined together and a PMC III (Personal Music Center 3) remote control, the units can operated in sync with each other, or if desired separately. If done separately the factory remotes would have to be used.

*** how will you incorporate the Headphone jacks at each seat location for music at each seat?, will the wireless headphones still operate?
