Jeffrey

Below are some references that show how sexual behavior questionnaires have been validated. I believe these issues have been well addressed and am not concerned that we can get good data on changes in sexual behavior within individuals over time in relation to variables like the incidence of new STIs

Nathan

The test-retest approach with a strong sexual behavior scale seems like the best way to screen:

1) Test-retest reliability and predictors of unreliable reporting for a sexual behavior questionnaire for U.S. men.
<<http://www.ncbi.nlm.nih.gov/pubmed/19705273>>

2) Test-retest reliability of self-reported HIV/STD-related measures among African-American adolescents in four U.S. cities.
<<http://www.ncbi.nlm.nih.gov/pubmed/19237106>>

Another approach is interpartner reliability/comparison, which would lead us in the direction of partner contact tracing:

3) Reliability of self-reported sexual histories: test-retest and interpartner comparison in a sexually transmitted diseases clinic.
<<http://www.ncbi.nlm.nih.gov/pubmed/9918321>>

4) Interpartner reliability of reporting of recent sexual behaviors.
<<http://www.ncbi.nlm.nih.gov/pubmed/1746526>>

There are lots of standardized instruments on sexual behavior and STI transmission, including the National Survey of Family Growth and General Social Survey:

5) Sexual partnership patterns as a behavioral risk factor for sexually transmitted diseases. <<http://www.ncbi.nlm.nih.gov/pubmed/10723647>>

If we proceed with a cohort study, we can think further on how we would structure that.

Thanks,
Karen
