Most things that matter in the real world aren't "main effects" (in a stats sense), but rather are "interaction effects." The trick is to remember that when context changes, many of the interactions change -- and hence the way the ensemble affects you changes. And we humans are crappy at thinking about interactions at all, let alone complex higher-order ones. So it's very difficult to predict how a big change will affect someone.
Switching topics: Ben forbids me from sharing the document. He wants to talk to you instead. Let me know if that sounds like entertainment...

Thanks for lending your car and associated neural tissue.
