Im looking forward to our time next week, I think the fields of synthetic intelligence and artificial General intelligence might provide you new insights into how systems and humans learn , Drives , goals , need for competence. (games either dumb down or ratchet up the levels in order to keep satisfying the drive and then increasing the challenge. The more exciting is that each human has its own learning algorithm, the individuality of it protects it from predators. (other humans reading its code). If another human can hack your system, you usually end up as prey. ie great running backs running pattern is incomprehensible to most others making them difficult to tackle .
