**Subject:** Re: do these things work

I've configured your AT&T Unite Wireless Hotspot to use the network name JEE Unite, with the password sarahsarah.  
It will not work in most of 71st St because the AT&T signal is too weak inside the building.

These are external antennas for a specific AT&T broadband card. They would be useful for fixed locations where:

- there was saturation of AT&T signal outside but poor signal penetration inside (ie 71st St), and
- you had no terrestrial internet connection options (cable internet or FIOS will always be faster and better), and
- only needed to get one computer connected (does not work with iPhones, iPads, □tv, etc.)

It basically runs a cable from a box which is mounted outside to a desk to plug into the USB card:

<3859\_1516\_momentumjack.jpeg>

It wouldn't work for the Ranch because:

1. It only connects ONE computer, via USB (can't integrate it into the wifi network)
2. It is a fixed cable that you're tethered to (not moving it between rooms)
3. HSPA+ (which AT&T brands

as 4G) is much slower than LTE, generally maxing out at 5 Mbps download.

The VZW connection at the ranch is averaging 18 Mbps for download via LTE with the HomeFusion equipment currently installed.

AT&T has NO LTE coverage of that region (HSPA+ only), so even if there was an LTE version of this antenna / card, it wouldn't work because AT&T hasn't built out their LTE network in that area.
