It would be fantastic if you come to the house late on Monday! if you can just let me know around what time it would be great so I can log out time on Jeffrey's calendar!

>>> These tend to grow over time. Even if it is not symptomatic now, it may become symptomatic in the future. However, if we wait until it is symptomatic to remove it, it will be much more larger then, and more difficult surgically to do because it is adjacent to critical structures - brachial plexus, major arteries. So, if we think it will grow to the point that it will need to be removed in the future, then it is better to nip it in the bud and remove it now - when it is surgically easier and safer to do.
