P.O. NO.

ITEM	DESCRIPTION	QTY	COST	TOTAL
	** Chemically strengthened glass is a glass product that has been strengthened by means of an Ion exchange process. This process increases the thermal and mechanical strength of common annealed soda-lime-silicate glass without affecting its optical properties. The process is particularly useful for thin glasses that cannot be thermally tempered. Chemically strengthened glass should be viewed as a strengthened glass product with its own special characteristics and advantages and not as a substitute for thermally tempered glass.
