Should i look into world water solar?

The other company brad from pro solar referred to was elemental water makers.

Per Brad: They have system that makes just over 11K gal per day. This system will use 80kWh. Any systems larger than this will need additional solar production from GSJ current plan .

Rich,

As we discussed, I have been involved with a solar energy/water company for several years (my long term friend and Puerto Rico business partner for more than 20). The company has a proven and patented self-contained system that uses solar panels to run a water purification system that makes dirty and contaminated fresh and/or salt water drinkable. The systems are of different sizes, with the larger ones able to purify tens of thousands of gallons per day (though less for salt water). I understand that my Puerto Rico friends are trying to get a unit or two sent to Virgin Giorda and/or the USVI.

The website is [REDACTED] Let me know if you would like more information.
