Proposed Licensed Replacement Link for Zorro Ranch

The microwave link proposed for Zorro Ranch to replace the existing unlicensed Adtran 2.4 Ghz Link, will support the current T-1 configuration that delivers the carrier services for data and voice. The Exalt microwave equipment interface will support up to 4 each T-1 Lines in addition to a GigE Port for Ethernet connectivity at a later date. The equipment was selected to provide the dual support that would be necessary to support both T-1 and Ethernet connectivity concurrently for changes services at a later date to MPLS or DSL. The current quote provides for both types of interfacing.

The quotes have been updated to reflect the changes resulting by installing the 5.8 Ghz Alvarion system to replace the out dated 2.4 Ghz equipment that was damaged by lightning damage earlier this year. There were a couple of changes that were made to address the delivery of WiFi to the Bunkhouse area and the overall capacity of the wireless delivery system for voice and data. The proposed system will still provide the capacity for all of the required voice and data services proposed in an IP environment.
