Dear Jeffrey,

Back to my office this morning from a two day trip where I just found your email.

As you rightly say the sketches I sent you were just a "first pass". However I do feel that the idea of a pergola (protected by the wall of the upper terrace) and reconnected to the lower part of the garden by a succession of natural looking tiers built with boulders and planting of grass and bushes might very well be one of the possible solutions to make this part of the island both resistant to the hurricanes and attractive to look at.

Should this proposal be given a more detailed study, do realize that the height of the pergola and the number of the following tiers would have to be reconsidered and adapted to the grading of the existing slope. Decorative and practical elements such as walls and "dry river" would be fully integrated as part of the whole design. Needless to say a proper parking area for the bike would also be included in the final design.

Believe me I do know how difficult it can be to visualize what is no more than a concept when confronted to the reality of the land (and I am speaking for myself) but I sincerely feel that if you still wish we could adapt this proposal for the greatest benefit of this section of your property.

Looking forward to hearing from you and to having a chance to discuss further up this project when you are back to New York.

With my very best regards,
Christian.
