Jeffrey,

If you decide to install the mirror on rear bulk head, I need to make sure there is a layer of insulation behind the mirror, there is a great deal of transmission noise the is generated to the tail compartment would effect our acoustics right behind your head. The fabric you have currently installed is acting like a muffler and noise filter.

Do you thinks its best to wait until our first annual inspection to install the mirror, since we have to remove the headliner to access the rear bulk head to install the mirror? these are all components of the cocoon interior, I'm leery of loosing the quite db's we currently have.

I will have Eric Fedex sample board of mirror to palm beach for your review.

your thoughts?

thanks,

Larry
