This is what I was mentioning you about the roles of codons on viral replication and how this could be used to prevent infection (immunize) host to various pathogens (in this case Polio).

I am sending you first a non-technical story written for NYT (still interesting)

<http://judson.blogs.nytimes.com/2008/09/02/braking-the-virus/>

After that two interesting papers about the same issue but in a technical language with data.

Let me know what do you think.

Boris
