Hello Jeffrey
here is the new company that I am involved with
The web site
<http://www.risst.ca>
warmest regards
Daniel

The BIOSCAN IDEXCELL scanner « scans » your internal fingerprint, i.e. inside the finger (around 1mm under the skin), where visible fingerprints appear. This internal fingerprint is revealed to the BIOSCAN scanner thanks to the blood flow conductive characteristics, commonly known by “capacitive effect”.

Thus, the “picture” taken by the BIOSCAN scanner is insensitive to the exterior condition of the skin (humidity, BIOMETRIC SCANNER OF INTERNAL FINGERPRINT WITH A BLOOD FLOW THE BIOSCAN SCANNER cuts, oil layer, dirtiness...), which makes this technology much practical for the “daily” use.

This technology allows preventing fingers “copying”, as well as eliminating the fear caused by science fiction as to having a finger cut off: a cut finger lacking a blood circulation won’t comprise the needed properties to be identified by the BIOSCAN. Using subcutaneous fingerprints (the “trace-free” biometric technique) we considerably increase the security level as compared to other fingerprint scanning technologies. The internal blood flowing fingerprint is the only invulnerable source.
