Hi Deepak:

Enjoyed your video on Stephen Hawking and other atheists' positions. You have eloquently described the current limitations of the mainstream science to describe the "Ontological Primitive Reality" or existence.

As you mention, current scientific theories include EM strong and weak nuclear forces and gravity. However, so far science has been unable to develop and integrate the missing physics of anti-gravity or spontaneous expansion of the universe as evidenced by Hubble. Einstein tried to fudge the anti-gravity via a fudge factor – "Cosmological Constant" that he later called his biggest blunder. The recent Supernova observations have pointed to an accelerated expansion (beyond the linear Hubble expansion) in the far-field universe leading to the speculation of Dark (unknown) Energy signifying a strong anti-gravity force in the universe.

What is astonishing that when the physics of the well-known spontaneous decay of particles is integrated into general relativity, it leads to a physical mechanistic theory of anti-gravity that predicts the empirical observations of the universe, explains the dark energy and accelerated expansion of the universe. It also resolves the key paradoxes of QM eliminating the Big Bang singularity and associated incredible phenomena such as the superluminous inflation, multiple universes, and eventual death of a purposeless universe.

What is even more wondrous that such an integrated model of the physics of spontaneity provides a scientific (physical and mathematical) basis for the Zero point state of the "Ontological Primitive Reality" described as the unmanifested (fully dilated mass/energy), Eternity (fully dilated time), Omnipresence (fully dilated space) at the speed of light. (This is synchronous with the experiences of the spiritual masters and sages during deep meditation or Samadhi or Enlightenment (fully dilated Ego)).

What is significant and noteworthy here is that in spite of the fact that such a Zero-point state is immeasurable (unmanifested) and experimentally unverifiable, but it is humanly experience-able, repeatable, and it does follow the same

sets of universal laws that predict the empirically observed universe resolving its current paradoxes. It also leads to a scientifically describable universal consciousness or existence synonymous with the "Ontological Primal Reality".

Mainstream science needs to recognize and integrate the missing physics of spontaneity as a possible panacea to curing the current paralysis of science as well as solving the mystery of the observed universe and the experienced consciousness. Such an integrated approach would not only bridge science and spirituality, but also provide purpose and meaning to the universe and life in it.

Consciousness (Free Will) is a non-local universal phenomenon not a local or biological (brain) phenomenon. Hence, no local (space-time limited) treatise of consciousness can explain consciousness. It is like trying to explain the elephant by its tail or to explain blue skies via a cloud. It is also like churning water to produce butter.

A computer only generates numbers (bits) not consciousness. A computer has no self, free will or awareness of its own.

As for consciousness the fact is that we are relying on consciousness in order to ask the question What is consciousness? And the fact that after all the advancements in computer science we can fundamentally disagree on such a basic question as to whether consciousness is computer generated or not means that ultimately we will never be able to completely answer that question.

No. That's like saying, because "we" are all confused now, "we" will all be confused in the future. What kind of scientist would accept a proposition like that?

Subject: Re: SV: [Sadhu Sanga] Consciousness

Dear Soren & Witt

I think most scientists would agree with the propositions of Seth Lloyd in his book Programming the Universe that the universe is a gigantic quantum computer (although why in this age of miniaturization a quantum

computer needs to be the size of the universe to generate the universe is another question). If Seth Lloyd is right then everything in this universe is ultimately computer generated.

As for consciousness the fact is that we are relying on consciousness in order to ask the question What is consciousness? And the fact that after all the advancements in computer science we can fundamentally disagree on such a basic question as to whether consciousness is computer generated or not means that ultimately we will never be able to completely answer that question. It is the same for physicists seeking the theory of everything. They are entities within the universe seeking to know everything about the universe. They are ultimately bound by the program that set them up in the first place. This is the way Seth Lloyd explains it: "Gödel showed that the capacity for self-reference leads automatically to paradoxes in logic; the British mathematician Alan Turing showed that self-reference leads to uncomputability in computers."

When a computer processes data the data contains instructions to the computer as to its source. Virtual drives are set up on computers that give the computer false information as to the source of the data and the computer is none the wiser. This is what I meant when I said that computers are tricked every day as to the source of the data they are processing. Sensory data contains instructions that it is coming from a physical external world, but it ain't necessarily so.

Kind regards
Brad

Dear Brad

As a biologist I will deny that we are a computers in the Turing understanding of it. I know we try to imitate living neural networks in the dead computers we have now. It gives a few steps forward but does not really solve the deed problem. You need to define a much more general model for computation that can cover what our machine do as well as living organisms including those without a brain do and how socio-communicative function. As a scientist and philosopher I have to say that we have not agreed on what we are or what the world is constructed from. No doubt the concepts of matter, energy, force and information are depicting true aspects of reality, but when I in neurobiology and psychology was looking for experience and qualia in the nervous system, I – and nobody else - did not find any. There is some insufficiencies on our metaphysical framework. This is why i am interested in the debate with other cultural metaphysics of which Advaita Vedanta is one of the more interesting and I think can be brought into harmony with a new physical understanding build on quantum physics and non-equilibrium thermodynamics systems science and cybernetics and last but no least Peircean semiotics.

Dear Soren

Well you know it is undeniable in my opinion that consciousness is computer generated. It is also undeniable that we are a computer generated entity that is trying to figure out what it is. Ergo we come up against that fundamental principle in computer science that we can't think outside the program. Once you accept the fact that consciousness comes from sensory data then all bets are off as to the actual source of that data. Computers are tricked every day as to the source of the data they are processing.

Kind regards

Brad

With respect I think consciousness is the easiest thing of all to explain. It is the representation of sensory data on the cortex of the brain that acts as a sophisticated television screen that we can smell taste and touch as well as see and hear. The knotty question is whether that sensory data actually comes from a real physical external world as it appears to do, or whether the source of that data is within us as per the Hindu tradition. My vote is for the latter.

Kind regards

Brad

On 18 Jul 2016 7:13 a.m., "Peter Moskovitz" <[redacted]> wrote:

I've no idea how my email address got attached to this conversation and I'm rather certain that my comments will be unwelcome, but, arrogant pedant that I am, you shall have them.

That Dawkins does not understand consciousness comes as no surprise.

Any conversation with Hammeroff is, a priori, non-informative. Consciousness obeys the laws of chaos (randomness does not occur in nature), as do quantum fields, but consciousness has nothing to do with the perturbation of quantum fields in any part of the nervous system. It was a nice try, but a silly one.

Consciousness has no contents. It is about something (intensionality) but it has no contents, nothing that can be observed, measured, recorded or analysed. Therefore, there is no "granularity" of consciousness: qualia do not exist. The hard problem is an illusion. Mysterianism is not so much a lack of knowledge as it is a lack of imagination and insight.

As Adam Zeman put it: If your theory admits to the existence of zombies, your theory needs fixed. You have to say that with a Scottish accent.

Consciousness (the feeling of what happens, the remembered present) is the experience of perceptual contents. Do not mistake this definition with "the contents of perceptual experience". They sound alike, but the word order changes the meaning completely. Perceptual contents are the neural representation of stimuli, internal or external. Neural representations can be observed (if one's instruments are good enough), measured, recorded and analysed. The experience of the representation cannot, it is subjective, entirely subjective. Experience has no contents. Spirituality is a state of experience but it is not the "contents" of experience. (Which is one reason why the DL has declared that if neuroscience disproves his beliefs, he will search for new beliefs, brave fellow.)

Consciousness is the synchronous oscillation of massively interconnected, multidimensional, recursive circuits, networks and systems throughout the global workspace. What enters awareness probably oscillates at about 40 hz. Oscillation at partial and harmonic frequencies probably effect how the perceptual apparatus represents transduced stimuli, how other perceptual contents enter consciousness and awareness and how contents are retained to enter awareness later, when the stimulus is remote. The theory has no empirical support, though parts of it have been validated. It's not new, and certainly not with me. Theorists and investigators I like include Crick and Koch, Rudolfo Llinas, Wolf Singer, Henry Markram and many others. Certainly **not** Chalmers, Jackson, Nagel, McGinn, Hammeroff and Penrose, etc.

Sorry, I warn most people that they shouldn't "get me started".

I promise I'll send no more.
