briefly, trivers and I share the same belief in the major role of deception. - a tool to protect or conquer free energy.. in essence if the predator can read your algorithm, you are easy food . so deception is the first line of defense as it usually the cheapest. if a prey knows its own algorithm it is open to interrogation. so nature hides it from the "self". Deceptive self confidence is also a winning game strategy. Ants engage in the practise of mimetic. camouflage. , false direction. etc. To some extent, so do most viruses. ie since HIV clearly masquerades itself as a unit of self. your question re is deception increasing, - yes as fast as methods of detection. note I assume you are awake
