Had a conversation with nick yesterday and we both agree that the issue is most likely not the subs but the mains.

The reasoning behind this is

1

when we got there the main speakers were blown

2

the subs are only on level 2 out of 10 (the calibration software put the level at .09 I had nick raise it to 2 to give you some push but i fully understand you want more)

Your new sunfire is incredibly powerful 400 watts a channel (thats huge!)

those jbl will never take the power of that amp at full volume that is why I had nick cap the max volume so the speaker are less likely to blow

I wish we had had a chance to review this in person getting new mains and turning the volume up on the subs is prob the best solution.

I know you have issues with the projector at LSJ so getting nick to swap that HAS major value after you taken care of there, I would like to work with you on how to resolve the sixth floor with or without nick nick and i are CURRENTLY working well together just FYI

your long term AV needs is my main concern and I am ready for the challenge no matter what vendor you are using at that time.

thank you

Scott
