---

cool exhibit at museum of science and energy - too bad it's in oak ridge, tennessee:

<http://www.amse.org/content.aspx?article=1863&parent=1841>

also was thinking, why don't we just create a cool temporary drug that raises core temp to like 108 degrees for 2 hours? that would kill all active bugs without denaturing our proteins. fever doesn't kill us. (what's annoying is the cooling part, we do that for brain stuff and when we "thaw" people bad things happen). anyway, i think nature was on that path with interleukins but it didn't quite get there since fever usually is only to 100 or 101. would be cool: reversible thermoregulation as a treatment for acute hematogenous pathogen eradication

ok i'm going to sleep. getting cranky over here. tired of people picking on me.
