I suggest the Center for Projective Communications. Like projective geometry of the 17th century, projective communications takes into account the appearance of truth as a projection from a context space. Though a statement appears true, it is merely a scalar projection from a complex space that involves various perspectives. Imagine a square on a plane. that is its appearance. it could be merely a projection of a cube or various other figures according to the light source and its orientation. what we perceive as a true signal can be the projection from a space that includes deception. so that to break down $1 + 1 = 2$. it is the appearance of a 1, though each may be be the projection of another number, ie deception.

``I freely confess that I never had a taste for study or research either in physics or geometry except in so far as they could serve as a means of arriving at some sort of knowledge of the proximate causes...for the good and convenience of life,
Girard Desargues
