Good day Rich.

Pro solar tech Dan Chrisman was out on Monday as scheduled and was there until 2:30 working on programming within the SMA inverters.

He reset charging parameters so as to allow the batteries to be brought up to a higher voltage while charging during the day. So far that, and more prudent use of power on the island, has resulted in no further outages up until the point of writing this.

He did not address anything with regard to wiring or repairs on the batteries themselves.

He reiterated once again their inability to purchase any replacement parts/circuit boards for our batteries.

I have not spoken to Brain regarding Monday's work nor has he tried to contact me.

The issue of outages seems to be under control albeit with a very soft footprint regarding power demands but the batteries are going to continue to corrode and degrade unless dealt with in some fashion in the near future.

Once a generator is installed that again will ease the issue as it will be called upon to keep the batteries charged-up under a larger demand, but again, the corrosion will play a larger and larger part going down the road.
