Last week, Japan announced that they are allowing human embryo gene editing (<https://www.nature.com/articles/d41586-018-06847-7>) in the lab.

By tremendous fortune, I happened to be in Tokyo last week speaking with a handful of investors. I got a bite (and now the question is, do I want to take /their/ money....).

Attached is an updated diligence doc of technical references. Did you want a second set of eyes to look at this?

One of the new references in the attachment ("Generation of human oogonia...") is a recent development regarding in vitro gametogenesis, i.e. producing sperm/egg cells from other tissues. Eventually this will mean we can make practically unlimited modifications to the cells before generating an embryo. This isn't a requirement for our initial work but it's a very important direction that will unlock more commercial opportunities.
