

compressor and use the electronic crossover and Audyssey Room Correction in the Marantz preamp to get the system tuned in. This will eliminate a lot of potential failure points and shorten the signal path which can improve sound quality.

Not without having them looked at. I have not seen any repair for less than \$100 for a long time. If it is simple cleaning, I'd say \$1-200. If parts are needed, \$200+. Also, expect 30+ days of turnaround time.

Brice, attached are documents showing the order and deposit for the Goldenear sub and replacement Klipsch tweeter diaphragms, and a current accounting of your account.

The Great Room system amps are having problems. It looks like the volume control pots (controls) have become unstable. The problem could be that they need cleaning and deoxidizing, or there could be more serious issues. This was discovered when we adjusted volume levels to improve the system sound quality, and sound intermittently cut out. We could remove them and send them to service or they could be replaced with new. With that problem and the blown tweeter issues taken care of, I believe we can get the Great Room system sounding like it should. I propose we bypass the Rene crossover and DBX
