Good morning Larry,

As of now wings are sanded, A/C is being masked and we are preparing to start painting wings. Worst case scenario is we will be pulling trigger at 10AM hopefully sooner. The base takes 2 hours to dry before I can clear, the dry time per tech data sheet is 16 hours for clear. What time were you wanting to pick up your A/C on 24th of December? If you could work it into your schedule to pick it up later in afternoon that would be great. We are doing everything we can to try to get you your A/C asap. I want to thank you for your patience and support through this situation. Please advise with your plans.

Regards,

Good evening Larry ,

We are a little behind schedule, we are taking every precaution possible to ensure there is no more issues with wings or any further paint failures. Per tech data sheets the high build primer requires at least 12 hour dry time before sanding. I made the decision to let the primer sit for 24 hours before sanding to ensure it was dry and guarantee proper adhesion. As you can see from the pics I sent the left wing is completely sanded and the right wing is about half sanded. To be 100% honest and not beat around the bush with you, with this week being Christmas I don't see your A/C being complete until Friday. We will finish sanding tomorrow and take mil readings and average paint thickness to be sure to stay within our limitations. We will then unmask A/C entirely and wash re mask and paint wings tomorrow or 1st thing Christmas Eve morning I am personally going to paint it. I apologize if this puts a damper on your plans more than this entire situation already has. Possibly could be sooner than Friday. Please advise with your plans
